The decision to replace missing or damaged teeth with dental implants can be life changing, they can restore your smile, your confidence and your ability to enjoy the foods you love. We have completed thousands of implants, enabling patients with a wide range of dental needs to enjoy a new lease of life. Our highly trained team of implant surgeons will create a bespoke treatment plan to suit you, ensuring you are fully informed and comfortable every step of the way.

This guide answers some of the most frequently asked questions about dental implants, however, only a personal consultation can confirm whether they are right for you.

What Is A Dental Implant?

A dental implant is a small titanium screw secured to the jaw that acts like a natural tooth root. Once the implant has fused with the bone, a crown, bridge or restoration is secured to the implant.

What Are The Benefits Of Dental Implants?

- Dental implants look and perform like natural teeth
- They are permanently attached and secure
- They enable you to eat whatever you like
- They help preserve bone in the area of the missing teeth and protect your facial structure
- They prevent movement and drifting of teeth, which can disrupt your bite
- Implants can be cleaned and cared for just like natural teeth
- They do not cause the gum irritation and inflammation commonly associated with dentures
- There is no need to drill or remove neighbouring healthy teeth

Are Dental Implants The Best Way To Replace Missing Teeth?

Dental professionals widely agree that implants can achieve the most natural looking and long lasting solution for missing or damaged teeth. Their durability, functionality and realistic appearance has led to growing demand as patients look beyond traditional dentures and bridges to a more effective solution for tooth loss.

What Is The Success Rate For Dental Implants?

Dental implants have a success rate of over 95%.

Contraindications for implants include:

- Periodontal gum disease
- Heavy smoking
- High alcohol intake
- Teeth grinding
- Severe or poorly managed diabetes
- Conditions that suppress the immune system

Would Dental Implants Work For Me?

Dental implants are suitable for most adults, provided they have sufficient bone tissue.

What Can Be Done If I Don't Have Sufficient Bone Tissue To Support Implants?

Inadequate bone tissue may necessitate a surgical bone grafting procedure before implantation. Over time, bone in the area of missing teeth will naturally shrink and a bone graft may be required to ensure stability for the implant. During your consultation you will be advised whether a bone graft or a sinus lift procedure will be necessary in your case to ensure the stability of the implant.

How Much Do Dental Implants Cost?

The cost of implants varies from case to case, depending on how many teeth need to be replaced and whether you will need supplementary procedures, such as a bone graft.

Our prices are competitive and transparent. A full breakdown of the cost of your treatment will be included in your treatment plan to ensure you are fully informed before proceeding. We offer interest free financing to help spread the cost of your dental implants.
